

Data Structure Assignment 6

Paper Homework

1. Show that given that $|V(G)| = n$, a spanning tree has $n-1$ edges.

The definition of the spanning tree:

1. Any tree that consists solely of edges in graph G and that includes all the vertices in G .
2. A minimal subgraph, G' , of G such that $V(G') = V(G)$ and G' is connected.

The minimum number of edges(e) required for a graph to be connected is at least $n - 1$ ($e \geq n - 1$), so if $e < n - 1$, the graph won't be connected(or it won't include all the vertices), and if $e > n - 1$, there will be a cycle(or more) in the graph, the graph will still be connected after removing an edge on a cycle, hence it's not minimal, so a spanning tree can only have $n - 1$ edges, no more and no less.

2. Given a dfs spanning tree(Figure6.20(b)), complete the following table of it.

Vertex	0	1	2	3	4	5	6	7	8	9
<i>dfn</i>	4	3	2	0	1	5	6	7	9	8
<i>low</i>	4	0	0	0	0	5	5	5	9	8
